Revision: 1.4

Abstract

This documentation provides the necessary steps to build a 2.4.x Linux kernel with devfs support on an x86 machine, and to compile and test the fuds module with user-space driver examples. The Redhat 9.0 (shrike) distribution is used for testing.

1 fusd HOWTO

1.1 Step 1

Download a stock Linux-2.4.21 Linux kernel [4] to /usr/src from:

```
http://www.kernel.org/pub/linux/kernel/v2.4/
```

1.2 Step 2

Extract the kernel sources:

```
cd /usr/src
tar xjvf linux-2.4.21.tar.bz2
```

1.3 Step 3

Choose the following kernel options for devfs and compile the kernel:

```
CONFIG_EXPERIMENTAL=y
CONFIG_DEVFS_FS=y

make clean
make dep
make bzImage
make modules
make modules_install
cp arch/i386/boot/bzImage /boot/vmlinuz-2.4.21
mkinitrd /boot/initrd-2.4.21.img 2.4.21
```

1.4 Step 4

Update the boot-loader:

Lilo was used and an entry for the new kernel is added to /etc/lilo.conf:

```
image=/boot/vmlinuz-2.4.21
label=linux-fusd
initrd=/boot/initrd-2.4.21.img
read-only
append="root=/dev/hda1 devfs=nomount"
```

Run /sbin/lilo to update the lilo. If using grub, just add an entry for vmlinuz and initrd in /boot/grub/menu.lst.

devfs cannot understand root=LABEL= directives in the bootloader. Hence, don't use such conventions in the bootloader or in /etc/fstab. By default, we don't want devfs to mount on boot-up, hence passing devfs=nomount will not mount it during boot.

1.5 Step 5

Install devfsd.

devfsd is a daemon that needs to be installed. We used the devfsd-2.4.3-12.i386.rpm file.

```
rpm -ivh devfsd-2.4.3-12.i386.rpm
```

1.6 Step 6

Remove any /dev/pts entry in /etc/fstab.

devfs will handle /dev/pts so any existing entry in /etc/fstab needs to be removed.

1.7 Step 7

Reboot!

Reboot into the new Linux-fusd kernel. If everything looks good, the system will boot. If you missed out on any of the above options, your system will be mounted as a read-only filesystem and might drop you to a console shell or may reboot.

1.8 Step 8

Compile fusd-1.10:

Download fusd-1.10 package to say /root, from:

```
http://www.circlemud.org/pub/jelson/fusd/
```

su to root and extract the sources:

```
cd /root
tar xzvf fusd-1.10.tar.gz
```

Change the kernel source path in the Makefile. Compile the fusd package which will build kfusd.o, libfusd.a and code examples:

```
cd fusd-1.10
make
```

If compilation is done cleanly, install it:

```
make install
```

1.9 Step 9

Mount devfs and start devfsd:

```
mount -n -t devfs none /dev  
devfsd /dev
```

1.10 Step 10

Load the kfusd.o module

The kfusd.o module is present in the objs.i686-linux/ directory in the fuds sources. Load the module:

```
insmod objs.i686-linux/kfusd.o
```

1.11 Step 11

Test the helloworld example:

```
objs.i686-linux/helloworld &  
cat /dev/hello-world
```
